

---

Executive Certificate in Medical Cannabis Care and Management

## Cannabis History And Culture

---

Ablation refers to the process of removing or destroying cancer cells or tumors using various methods, including heat or chemicals, and has been explored in the context of cannabis research as a potential treatment option.

Absolute Risk Reduction is the difference in the rates of an adverse event between a treatment group and a control group, expressed as a percentage, and is an important concept in medical research related to cannabis studies.

Access Point is a location where patients can access cannabis products, such as a dispensary or pharmacy, and is a crucial aspect of cannabis care and management.

Acetylcholinesterase is an enzyme that breaks down the neurotransmitter acetylcholine, which is involved in various physiological processes, including memory and learning, and has been studied in relation to cannabis use.

Action Potential is the electrical impulse that allows neurons to communicate with each other, and cannabis has been shown to affect action potential in various ways.

Active Ingredient is the component of a drug or product that produces the desired effect, such as THC or CBD in cannabis products.

Active Pharmacological Ingredient is the specific component of a drug or product that produces the desired therapeutic effect, such as THC or CBD in cannabis products.

Acute refers to a condition or disease that has a rapid onset and typically lasts for a short period, such as acute pain or nausea, which can be treated with cannabis.

Adaptation is the process by which the body adjusts to the presence of a substance, such as cannabis, and can lead to tolerance or dependence.

Addiction is a chronic disease characterized by the compulsive use of a substance, despite negative consequences, and cannabis addiction is a recognized condition.

Adjuvant Therapy is a treatment that is used in conjunction with the primary treatment to enhance its effectiveness, such as using cannabis to manage chemotherapy-induced side effects.

Administer refers to the act of giving or applying a substance or treatment, such as cannabis, to a patient.

Adverse Event is an unwanted or harmful effect that occurs as a result of a treatment or product, such as cannabis-related adverse events.

Adverse Reaction is an unwanted or harmful effect that occurs as a result of a treatment or product, such as cannabis-related adverse reactions.

Aeroponics is a method of growing plants, including cannabis, in which the roots are suspended in the air and nourished by a fine mist of water and nutrients.

Agonist is a substance that binds to a receptor and causes a response, such as THC, which is a CB1 receptor agonist.

Agricultural Hemp is a type of cannabis that is grown for its fibers or seeds, rather than its psychoactive compounds.

Agricultural Practices refer to the methods and techniques used to cultivate and manage cannabis crops,

including irrigation and pest control.

Airborne Contaminants are microorganisms or other particles that are present in the air and can contaminate cannabis products.

Alchemy is an ancient practice that involves the transformation of base materials into more valuable substances, and has been applied to the production of cannabis concentrates.

Alkaloids are a class of compounds that are found in plants, including cannabis, and have a range of biological activities.

Allergic Reaction is an overreaction of the immune system to a substance, such as cannabis, which can cause harmful effects.

Allopathic Medicine is a system of medicine that focuses on treating diseases with pharmaceuticals or surgery, rather than addressing the underlying causes of the condition.

Alternative Medicine is a system of medicine that involves the use of non-conventional therapies, such as cannabis, to treat diseases or conditions.

Alzheimer's Disease is a progressive disease that affects memory and cognitive function, and cannabis has been studied as a potential treatment.

Ambient Temperature is the surrounding temperature of a given environment, which can affect the quality and potency of cannabis products.

American Herbal Products Association is a trade organization that represents the herbal industry, including cannabis producers.

Amino Acids are the building blocks of proteins and are essential for various biological processes, including the production of cannabis compounds.

Ammonia is a chemical compound that is used in the production of cannabis fertilizers and pesticides.

Anandamide is an endocannabinoid that is produced by the body and has been shown to have a range of therapeutic effects, including pain relief and mood enhancement.

Anaphylaxis is a severe and potentially life-threatening allergic reaction that can occur in response to cannabis or other substances.

Anatomical Site is the location on the body where a treatment or product is applied, such as the skin or mucous membranes.

Androgen is a type of hormone that is involved in the development and maintenance of male characteristics, and cannabis has been shown to affect androgen levels.

Anesthesia is a state of unconsciousness or insensibility to pain, which can be induced using cannabis or other substances.

Angiogenesis is the process by which new blood vessels form, and cannabis has been shown to inhibit angiogenesis in certain cancers.

Animal Model is a research tool that involves the use of animals to study the effects of cannabis or other substances on biological systems.

Anionic Surfactant is a type of chemical compound that is used in the production of cannabis products, such as topicals and edibles.

Anodyne is a type of medication that is used to relieve pain, such as cannabis-based anodynes.

Antagonist is a substance that binds to a receptor and blocks or reduces the effect of an agonist, such as CBD, which is a CB1 receptor antagonist.

Antibacterial is a type of compound that is used to prevent or treat bacterial infections, such as cannabis-

based antibacterials.

Antibiotic is a type of medication that is used to treat bacterial infections, and cannabis has been shown to have antibiotic properties.

Antibody is a type of protein that is produced by the immune system in response to the presence of a foreign substance, such as cannabis.

Anticancer is a type of compound that is used to prevent or treat cancer, such as cannabis-based anticancer agents.

Anticonvulsant is a type of medication that is used to treat seizures or epilepsy, and cannabis has been shown to have anticonvulsant properties.

Antidepressant is a type of medication that is used to treat depression or other mood disorders, and cannabis has been shown to have antidepressant effects.

Antiemetic is a type of medication that is used to prevent or treat nausea and vomiting, such as cannabis-based antiemetics.

Antifungal is a type of compound that is used to prevent or treat fungal infections, such as cannabis-based antifungals.

Antihypertensive is a type of medication that is used to treat high blood pressure, and cannabis has been shown to have antihypertensive effects.

Anti-Inflammatory is a type of compound that is used to reduce inflammation or swelling, such as cannabis-based anti-inflammatories.

Antimicrobial is a type of compound that is used to prevent or treat microbial infections, such as cannabis-based antimicrobials.

Antioxidant is a type of compound that is used to prevent or reduce oxidative stress, such as cannabis-based antioxidants.

Antipsychotic is a type of medication that is used to treat psychotic disorders, such as schizophrenia, and cannabis has been shown to have antipsychotic effects.

Antipyretic is a type of medication that is used to reduce fever, such as cannabis-based antipyretics.

Antispasmodic is a type of medication that is used to treat muscle spasms or cramps, and cannabis has been shown to have antispasmodic effects.

Antiviral is a type of compound that is used to prevent or treat viral infections, such as cannabis-based antivirals.

Anxiety Disorder is a type of mental health condition that is characterized by excessive fear or worry, and cannabis has been shown to have anxiolytic effects.

Aphorism is a short statement or phrase that expresses a general truth or principle, such as the aphorism that cannabis is a medicinal plant.

Apoptosis is the process of programmed cell death, which can be induced by cannabis or other substances in certain cancer cells.

Application refers to the act of applying a treatment or product, such as cannabis, to a patient or surface.

Apprentice is a person who is learning a trade or skill, such as cannabis cultivation or extraction, under the guidance of an experienced mentor.

Aqueous is a type of solution that is made with water, such as an aqueous solution of cannabis extracts.

Arthritis is a type of inflammatory disease that affects the joints, and cannabis has been shown to have anti-inflammatory effects.

Artificial Lighting is a type of lighting that is used to supplement or replace natural light, such as in cannabis cultivation.

Aseptic is a type of environment or procedure that is free from microorganisms or other contaminants, such as an aseptic cannabis cultivation facility.

Aspergillus is a type of fungus that can contaminate cannabis products and cause harmful effects.

Assay is a test or procedure that is used to measure the quantity or quality of a substance, such as cannabis.

Asthma is a type of respiratory disease that is characterized by inflammation and constriction of the airways, and cannabis has been shown to have bronchodilatory effects.

Asymptomatic is a term that refers to a person or condition that does not exhibit any symptoms, such as an asymptomatic cannabis user.

Ataxia is a type of neurological disorder that is characterized by loss of coordination or balance, and cannabis has been shown to have therapeutic effects.

Atherosclerosis is a type of cardiovascular disease that is characterized by the buildup of plaque in the arteries, and cannabis has been shown to have anti-inflammatory effects.

Atmospheric Pressure is the pressure exerted by the atmosphere on a given environment, which can affect the quality and potency of cannabis products.

Atrophy is a type of condition that is characterized by the wasting or shrinking of a cell or tissue, and cannabis has been shown to have therapeutic effects.

Attenuation is the process of reducing the intensity or effect of a substance, such as cannabis, by diluting or weakening it.

Attribute is a characteristic or property of a substance or product, such as the attributes of cannabis that make it a medicinal plant.

Auditing is the process of examining or evaluating a system or procedure, such as a cannabis cultivation or extraction facility.

Autoimmune Disease is a type of condition in which the immune system attacks healthy cells or tissues, and cannabis has been shown to have therapeutic effects.

Autophagy is the process by which cells recycle or remove damaged or dysfunctional components, and cannabis has been shown to induce autophagy in certain cancer cells.

Avascular is a type of tissue or organ that does not have a blood supply, such as avascular necrosis in cannabis plants.

Ayurvedic Medicine is a system of medicine that originated in India and emphasizes the use of natural remedies, such as cannabis, to treat diseases and conditions.

Bacillus is a type of bacteria that can be used as a biological control agent to prevent pests and diseases in cannabis crops.

Bactericide is a type of compound that is used to kill or inhibit the growth of bacteria, such as cannabis-based bactericides.

Bagging is a technique used to enhance the flavor and aroma of cannabis by sealing it in a bag or container.

Ballast is a type of device that is used to regulate the flow of electricity to a lighting system, such as a cannabis cultivation facility.

Barcoding is a system of identification that uses barcodes to track and manage cannabis products, such as plants or extracts.

Batch is a quantity of cannabis products that are produced or processed together, such as a batch of

cannabis extracts.

Batching is the process of grouping cannabis products into batches for production or processing.

BHO is a type of cannabis extract that is made using butane as a solvent.

Bioaccumulation is the process by which organisms absorb and accumulate substances, such as cannabis compounds, in their bodies.

Bioavailability is the degree to which a substance, such as cannabis, is absorbed and becomes available to the body.

Biochemical is a type of process or reaction that occurs within living organisms, such as the biochemical processes involved in cannabis metabolism.

Biodegradation is the process by which microorganisms break down organic matter, such as cannabis waste.

Biodynamics is a type of agricultural practice that emphasizes the use of natural and organic methods to cultivate cannabis and other crops.

Biofilm is a type of community of microorganisms that adhere to a surface and can contaminate cannabis products.

Biological is a type of process or reaction that occurs within living organisms, such as the biological effects of cannabis on the human body.

Biomarker is a type of indicator or measure that is used to assess the effectiveness or safety of a treatment, such as cannabis.

Biomass is the total amount of living matter in a given environment, such as the biomass of a cannabis crop.

Bioremediation is the process of using living organisms to clean up pollutants or contaminants in the environment, such as cannabis waste.

Biotechnology is the use of biological systems or organisms to develop new products or technologies, such as cannabis breeding programs.

Bleaching is a process that involves the use of chemicals to whiten or lighten cannabis products, such as flowers or extracts.

Blending is the process of combining different strains or varieties of cannabis to create a unique product or blend.

Blending Ratio is the proportion of different strains or varieties of cannabis that are combined to create a blend.

Bloom is the stage of cannabis growth in which the flowers are produced, and is a critical period for cannabis cultivation.

Bloom Booster is a type of fertilizer or nutrient that is used to enhance the growth and development of cannabis flowers.

Body High is a type of effect that is produced by cannabis, characterized by a relaxing and sedating sensation.

Boiling Point is the temperature at which a liquid changes state and becomes a gas, such as the boiling point of cannabis extracts.

Boron is a type of mineral that is essential for plant growth and development, and is often used as a fertilizer in cannabis cultivation.

Botanist is a scientist who studies plants and their properties, including cannabis.

Botany is the study of plants and their properties, including cannabis.

Breeding is the process of selectively crossing different strains or varieties of cannabis to create new and unique plants.

Breeding Program is a systematic approach to breeding cannabis plants to create new and unique strains.

Bronchodilator is a type of medication that is used to relax and dilate the airways, and cannabis has been shown to have bronchodilatory effects.

Bud is the flowering top of a cannabis plant, which contains the highest concentration of THC and other compounds.

Buffer is a type of chemical that is used to regulate the pH of a solution, such as a buffer solution used in cannabis cultivation.

Building Code is a set of regulations that govern the design and construction of buildings, including those used for cannabis cultivation or processing.

Bulk is a large quantity of cannabis products, such as flowers or extracts, that are sold or processed in large amounts.

Bulk Density is the mass of a substance per unit volume, such as the bulk density of cannabis flowers.

Bud Rot is a type of disease that affects the flowers of a cannabis plant, causing them to rot or decay.

Bud Trimming is the process of removing excess leaves or stem material from cannabis buds to improve their appearance and quality.

Buffer Zone is an area of land or space that is set aside to separate or protect a cannabis cultivation or processing facility from other activities or operations.

Business Plan is a document that outlines the goals, objectives, and strategies of a cannabis business or operation.

Butane is a type of solvent that is used to extract cannabis compounds from the plant material.

Callus is a type of tissue that forms on a plant as a result of injury or infection, and can be used to produce new cannabis plants.

Calibration is the process of adjusting or setting the parameters of a device or equipment to ensure accurate and reliable results, such as in cannabis testing or analysis.

Calyx is the covering of the seed pod of a cannabis plant, which contains the highest concentration of THC and other compounds.

Cancer is a type of disease that is characterized by the uncontrolled growth and spread of cells, and cannabis has been shown to have anticancer effects.

Cannabinoid is a type of compound that is found in cannabis, such as THC or CBD.

Cannabinoid Receptor is a type of protein that is found in the body and is responsible for binding to cannabinoids and producing their effects.

Cannabis is a type of plant that is used for its medicinal, recreational, and industrial properties.

Cannabinoid Profile is the characterization of the types and amounts of cannabinoids present in a cannabis sample.

Capitate is a type of trichome that is found on the surface of cannabis leaves and buds, and contains cannabinoids and other compounds.

Capsule is a type of container that is used to hold or enclose cannabis extracts or other substances.

Carbon Dioxide is a type of gas that is used to stimulate the growth and development of cannabis plants.

Carbon Filter is a type of filter that is used to remove impurities and odors from the air, such as in a cannabis cultivation facility.

Carcinogen is a type of substance that can cause cancer, and cannabis has been shown to have anticancer effects.

Carcinogenesis is the process by which normal cells become cancerous, and cannabis has been shown to have anticancer effects.

Cardiovascular is a type of disease that affects the heart and blood vessels, and cannabis has been shown to have cardiovascular effects.

Caryophyllene is a type of terpene that is found in cannabis and has been shown to have anti-inflammatory effects.

Cash Crop is a type of crop that is grown for its economic value, such as cannabis.

Catalyst is a type of substance that is used to speed up or facilitate a chemical reaction, such as in the production of cannabis extracts.

Catharsis is a type of emotional release or purging that can occur as a result of using cannabis or other substances.

CB1 Receptor is a type of protein that is found in the body and is responsible for binding to cannabinoids and producing their effects.

CB2 Receptor is a type of protein that is found in the body and is responsible for binding to cannabinoids and producing their effects.

CBD is a type
